SIAB V1.0 / User Manual

This Guide goes into all functions and operation of the SIAB (SAMS-In-A-Box) handheld medical result and treatment unit.

The unit can be turned on by activating the rocker switch on the top of the unit, as the device boots up all of the LEDES illuminate to confirm they are working prior to using the device. When all lights are off and only the **STATUS** LED is lit red then the unit is ready.

Press the **RED BUTTON** to initiate the first stage of the device, diagnosis. The Status LED will change to yellow and the device will rotate the LEDES over the body image until a diagnosis is found. An LED will illuminate over the body area affected and the colour of the LED will show the severity of the injury and that will affect the recovery time to be implemented.

Green	Light	2 Minutes
Yellow	Moderate	4 Minutes
Red	Serious	7 Minutes

The Status LED will now be green (alongside the injury notification) and pressing the Heal button again will then send the recovery data to the sensor (be sure to hold the emitter close to one of the diodes on the sensor). The Sensor will beep when it has received the data and will then count down by beeping every minute until it has fully restored, the restoration beep will sound similar to the noise the sensor makes when it starts up.

If, after the diagnosis phase, all of the LEDES flash on and off with a Red colour then the character suffered a critical injury and should see a GM.

The SIAB is now ready for another Healing procedure.
